Analyse
IA

1. Ce qui est bien testé

Le test valide avec succès le *happy path* de la création d'un environnement via `EnvironmentSe` couvrant la validation des données d'entrée, la persistance en base (H2), et la bonne propagati réponse. L'initialisation du contexte de sécurité (via `SecurityContextHolder`) et la préparati (projet + membre) sont correctement gérées via `@BeforeMethod`.

2. Suggestion d'amélioration

Le test manque de vérification *spécifique* de la logique métier liée à l'autorisation (ex. : ` puisque le `ProjectMember` est créé \*avant\* l'appel – ce qui rend le test insensible aux erreur permission. Il serait plus robuste d'ajouter un assert sur une \*exception attendue\* (ex. `Busin l'utilisateur n'est *pas* membre, et/ou de mocker la méthode de vérification (si elle est extra

externe ou utilisant une logique complexe), afin d'isolation cette pré-condition.

*(Optionnel : on pourrait aussi élargir aux cas limites – nom vide, branches invalides – mais i
l'autorisation.)*

Corrections automatiques par IA

L'IA a detecte des erreurs dans certains scripts generes et les a corriges automatiquement.
